WHAT IS SPEEDNODE NETWORK?

SpeedNode Network – The powerful and Scalable on Ethereum Blockchain

SpeedNode Network is a framework for developers to extend their blockchain based on Ethereum. With the better version, SpeedNode will create the fastest global Blockchain network.

VISION OF SPEEDNODE

SpeedNode Network desires a world in which people and machines collaborate and exchange value globally and freely, without intermediaries.

We aim to change all the limitations by simplifying the interaction between users and the decentralized world. We want to build a network that connects and adapts all developers and users in the world. Therefore, we all can interact and communicate in the same language in the Blockchain world.

MAIN FEATURES OF SPEEDNODE NETWORK

High transaction speed: Thanks to the enhanced version, SpeedNode has the ability to increase transaction speeds thousands of times over normal speeds. This is also partly supported by the scalability of chains in the network.

Scaling chains: SpeedNode implements a new framework for digital assets and creates a decentralized network of Proof-of-Staked-Authority (PoSA) validators. This will let developers make their own products freely and enhance the interaction of their DApps with others.

Unify off-chain transactions: Unify and synchronize different off-chain payment solutions by bringing about common compatibility on the Proof-of-Staked-Authority (PoSA) protocol of SpeedNode.

MAIN FEATURES OF SPEEDNODE NETWORK

Minimum transaction fees: From improving transaction speed and scale blockchains to simplifying the work that chains need to handle, thereby reducing transaction fees.

Improve usability: When blockchains are compatible, transaction processing is faster, creating different DApps will be convenient and increase the blockchain ecosystem.

Security: SpeedNode combines Plasma with PoSA to create new chains on Ethereum that will further improve security by minimizing costs and work that the thread has to handle. Therefore, all DApps ensure a superior user experience in a secure and decentralized manner.

WHY SPEEDNODE NETWORK?

Multi-chain network

SpeedNode builds a multi-chain network with many modules suitable for developers who want to build fast and lean chains. SpeedNode was born for developers to remove the limits of Ethereum. There will no longer be low throughput and delay transactions anymore.

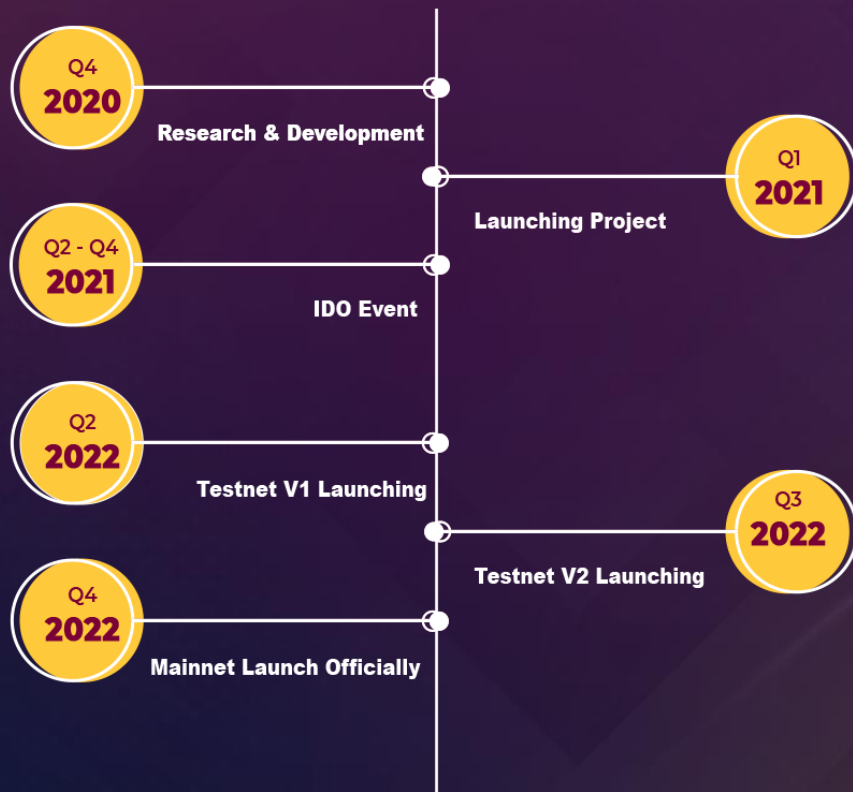

Easy to custom and optimize

Ethereum is known as poor UX, so it is very hard for developers to build a DApp that can be adapted while useful for users. SpeedNode allows all developers to custom and optimize chains to fit with their products. Then, they can scale it easily.
